OPTICAL OBSERVATIONS

20 cm Observing :

- Target : The Ring Nebula
- The Ring Nebula also known as MESSIER 57
- Distance from Earth: ~2283 ly
- Location: Lyra constellation
- Age: ~7005 years
- Formation: Death of a Red Giant -Star
- Feature: Lookjs like a donut
- Magnitude: 8.8

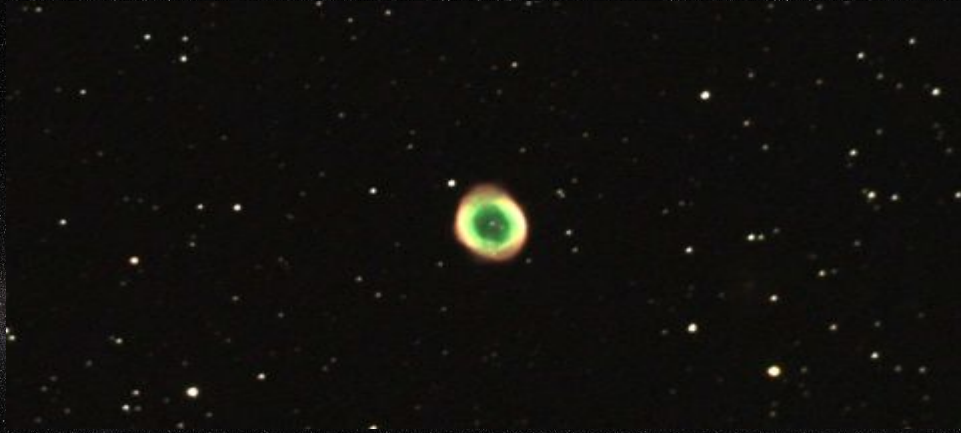

OPTICAL OBSERVATIONS

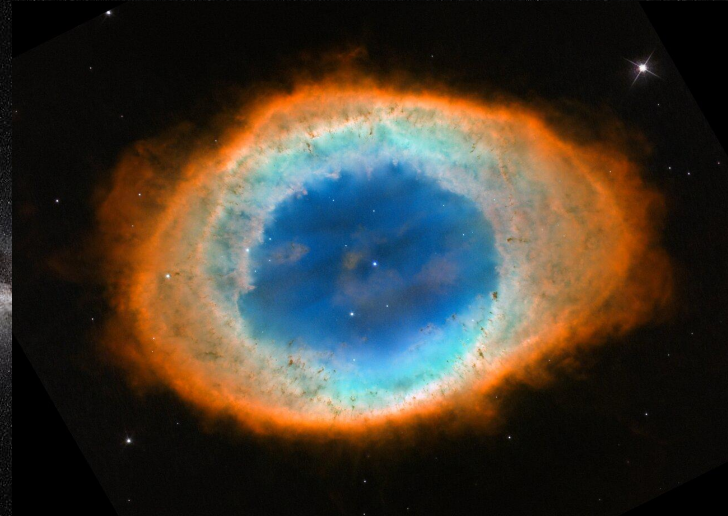

DATA ANALYSIS'S RESULT:

OPTICAL OBSERVATIONS

Ring Nebula from the 20 cm
Telescope

Ring Nebula from the James
Webb Telescope

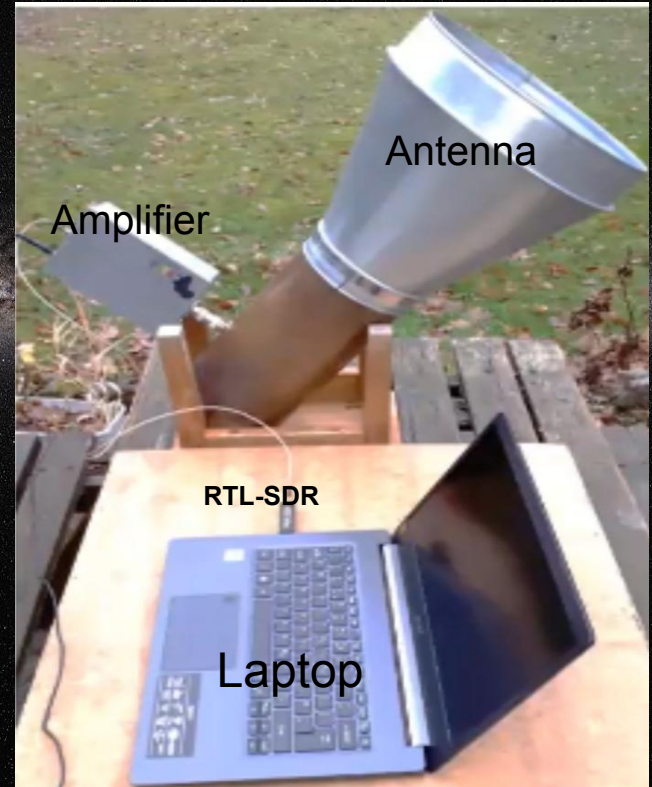

RADIO OBSERVATIONS

TTRT OBSERVATION (Table Top Radio Telescope)

- A smaller Radio Telescope.
- Detect Radio frequency signals from space.
- 21 cm Hydrogen line(HI).

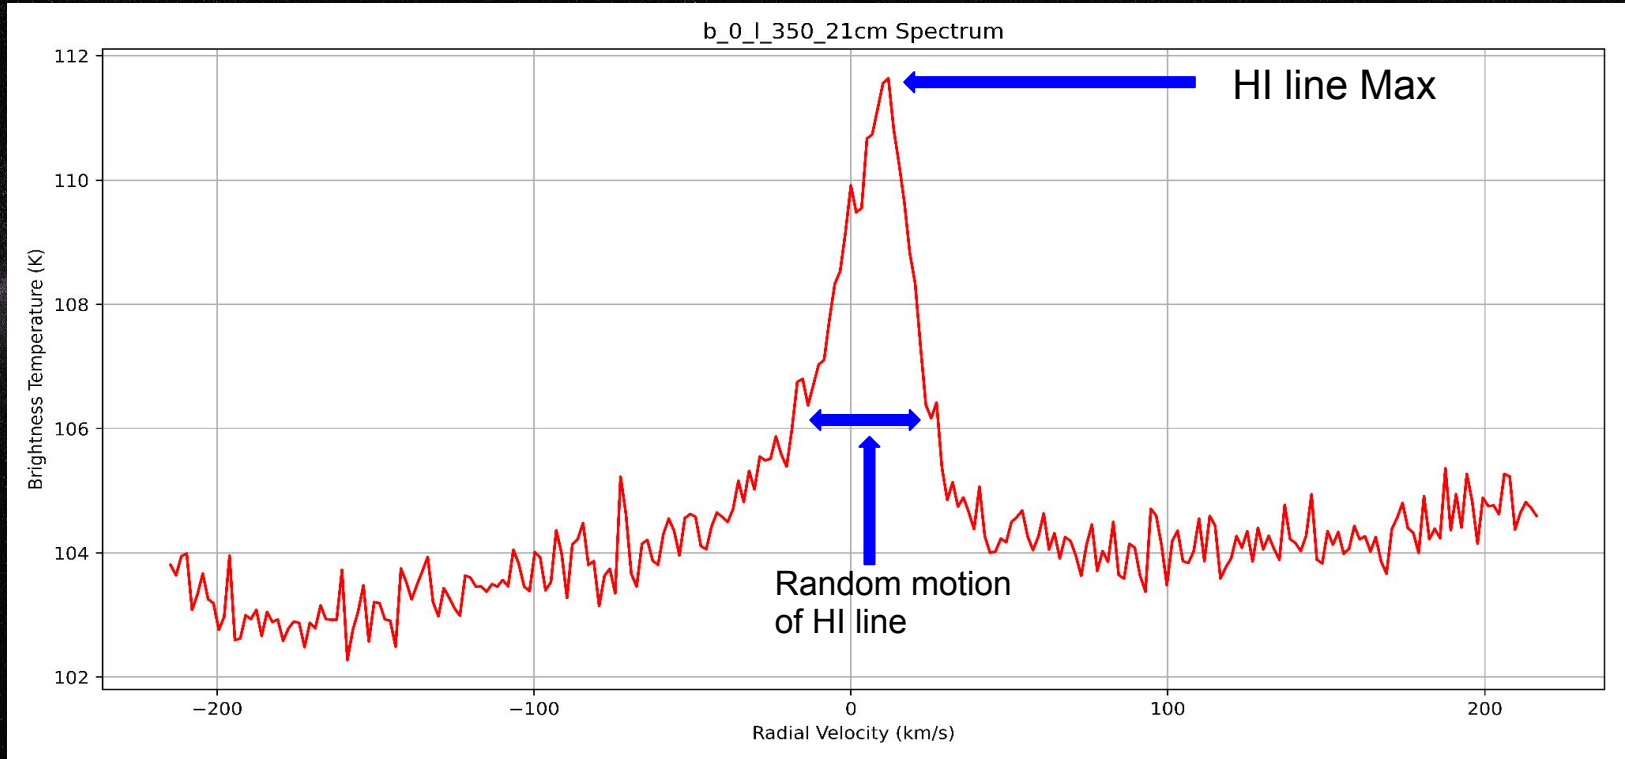

Objectifs :

- Mapping the Milky Way
- Observing clouds of galactic hydrogen in the Milky way

OPTICAL OBSERVATIONS (40cm TELESCOPE)

OVERVIEW of the TELESCOPE

Aperture: 40cm optical telescope

Detectors: CCD Detector

Target Star: RS Bootes (RS Boo)

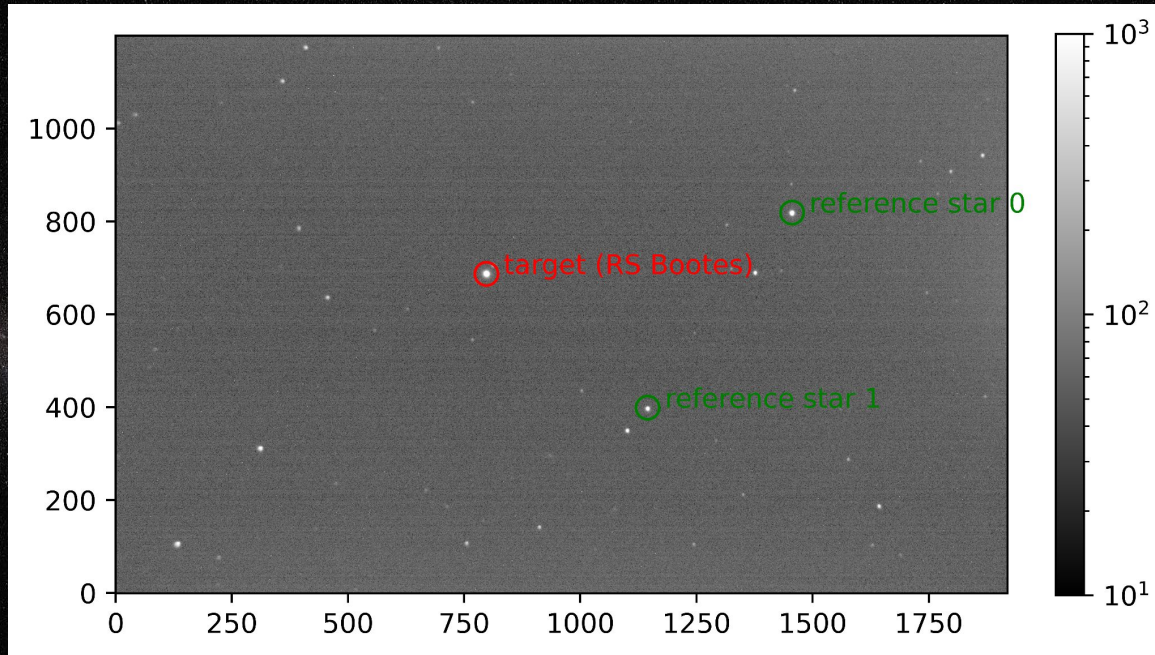

Goal: Detect and characterize brightness variation

40 cm TELESCOPE

STAR IDENTIFICATION

RS Bootes is marked
in Red, two reference
stars in green

THANK YOU !
